General Disease

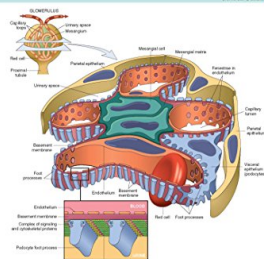

Figure 1-15 General features of ducts of exocrine glands.

The various types of glandular ducts, which are discussed here in the text, are shown in this diagram. The glandular ducts are classified into two main types: exocrine and endocrine. Exocrine ducts are those that carry secretions to the surface of the body or into a body cavity. Endocrine ducts are those that carry secretions into the bloodstream. The diagram shows the various types of glandular ducts, including simple, branched, and coiled ducts. It also shows the various cellular components of the ducts, such as the ciliated columnar epithelium, the microvilli of secretory cells, the basophilic cytoplasm, the nucleus, the basal lamella, the endothelium, the lumen, the mucous secretory cells, the capillary, the paracrine secretion, the vascular secretory component, the extracellular matrix, and the connective tissue.
